05 MAX STOP THAT STILL TAKES

SYM	STOP PTS	TICKS	MAX ATR	2+ CT PTS
MES	20.00	80	16.7	5.00
MNQ	50.00	200	41.7	12.50
MGC	10.00	100	8.3	2.50

If the stop your setup needs is wider than **Stop pts**, the engine skips it. Under **2+ ct pts** you size into more than one contract. Recomputes with your levers above.

Each card replays your v5 entry gates. The app can't see volume, pivots or FVGs, so you tap the confirmations that were true; the sweep depth, bias, score and risk are computed. This audits **why a trade qualified** — it doesn't replace TradingView's Strategy Tester over full history.

TUNING TO CUT LOSSES & GROW GAINS

Cap your worst-case loss

Largest loss -\$273.50 is 2.7x your \$100 intended max (maxRisk x cap), ≈ 4

average winners. Drop 'Skip cap x' toward 1.0 so the engine won't take a setup needing more than \$50 of stop, and/or switch to a tighter ATR stop (smaller ATR x). This is the single biggest leak.

Cut the slow losers

Losers run 11.4x longer than winners (84.4m vs 7.4m). Winners resolve in ~7.4m; a trade not near +1R by ~15m is usually wrong. The v5 engine has no time-stop — add a bar/'minutes-in-trade' exit to stop the bleed.

Currently net-negative

Profit factor 0.36 (<1), expectancy -\$34.32/trade. The two levers below — bigger winners and a higher win rate — are how this flips.

Win rate below the break-even line

At 0.95 : 1 reward:risk you need 51% wins to break even; you're at 27%. Close the gap by raising R or filtering entries.

Let winners run

Avg win $\approx$ avg loss (0.95 : 1). Winners average \$69.92 $\approx$ 1.4R while the plan allows 3.5R — profit is being taken too early. Lower the PTP scale-out (now 25%) so more size reaches TP1/Full, or trail the runner instead of scaling.

Filter weaker entries

27% of trades win and roughly half of contracts scratch at breakeven — setups arm then fail. Raise minScore 2 $\rightarrow$ 3, or require the nested 15m/5m zone (needLTF) so only cleaner sweeps fire.

Too small a sample to trust

11 trades — one outlier drives the whole result. Log 30–50+ before concluding, and change ONE parameter at a time (fork the alerts, restart the count) so you can tell what actually moved the needle.

Paste each week's Tradovate **Performance** numbers here. Recommendations are rule-based, tied to your v5 parameters — read them as analysis to test, not advice. Change one parameter at a time and re-measure.

Mirrors the v5 risk engine (ATR stops $\cdot$ size = max 1, floor(risk $\div$ 1-lot) $\cdot$ 25/50/25 scale-out at 1R/2R/3.5R). Scale-out dollars are a planning estimate — micros exit in whole contracts. Not financial advice.
